CANDIDATE NUMBER

PHYSICS **0625/62**

Paper 6 Alternative to Practical **October/November 2017**

1 hour

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.
Write in dark blue or black pen.
You may use an HB pencil for any diagrams or graphs.
Do not use staples, paper clips, glue or correction fluid.
DO **NOT** WRITE IN ANY BARCODES.

Answer **all** questions.

Electronic calculators may be used.
You may lose marks if you do not show your working or if you do not use appropriate units.

At the end of the examination, fasten all your work securely together.
The number of marks is given in brackets [ ] at the end of each question or part question.

The syllabus is approved for use in England, Wales and Northern Ireland as a Cambridge International Level 1/Level 2 Certificate.

This document consists of **12** printed pages.

1 A student is comparing the oscillations of two pendulums. Fig. 1.1 shows the first pendulum.

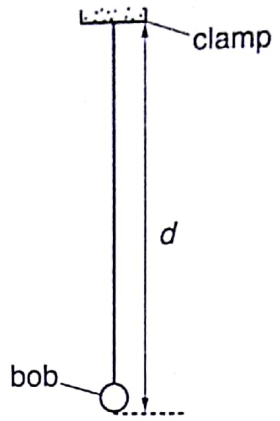

Fig. 1.1

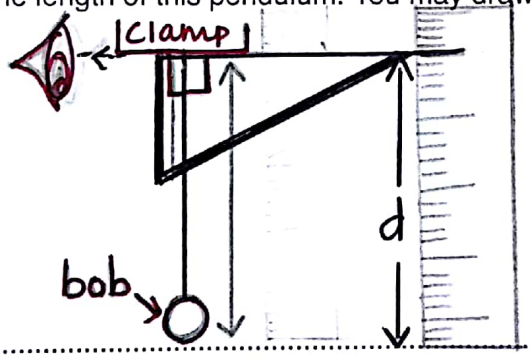
(a) (i) On Fig. 1.1, measure the distance *d*, from the bottom of the clamp to the bottom of the bob.

d = 5.0 cm [1]

(ii) Fig. 1.1 is drawn 1/10th actual size. Calculate the actual distance *D* from the bottom of the clamp to the bottom of the bob.

D = 50 cm [1]

(iii) Explain briefly how to use a set-square to avoid a parallax (line-of-sight) error when measuring the length of this pendulum. You may draw a diagram.



Fix the set square exactly where the string begins. Place a ruler at the other end of the set square as shown. View from the left of the set-up and mark off the measure [1]

(b) The student displaces the bob slightly and releases it so that it swings. She measures the time t for 20 complete oscillations. The time t is shown on the stopwatch in Fig. 1.2.

Fig. 1.2

(i) Write down the time t shown in Fig. 1.2.

t = 28·12 seconds [1]

(ii) Calculate the period T_1 of the pendulum. The period is the time for one complete oscillation.

28·12 ÷ 20 = 1·406

T_1 = 1·406 seconds [2]

(c) The student repeats the procedure using another pendulum as shown in Fig. 1.3. This has a long, thin pendulum bob. The distance D from the bottom of the clamp to the bottom of the pendulum bob is the same as for the first pendulum.

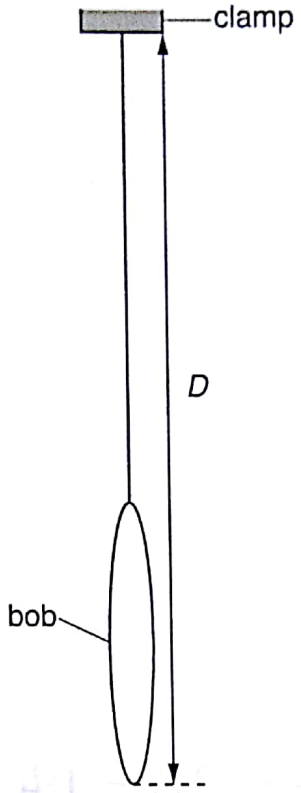


Fig. 1.3

She determines the period T_2 of this pendulum.

T_2 = 1.37 s

In this experiment, both pendulum bobs have the same mass. A student suggests that since both pendulums have the same overall length D and mass, the periods T_1 and T_2 should be equal. State whether the results support this suggestion. Justify your answer by reference to the results.

statement ....Yes:.....

justification ....The results are within the limits of experimental accuracy.....

.....[2]

(d) The period T of a pendulum can be determined by measuring the time t for 20 complete oscillations and then calculating the period. Some students are asked to explain the reason for this method being more accurate than measuring the time taken for a single oscillation.

Tick the box next to the sentence that gives the best explanation.

- [ ] The method eliminates errors from the measurements.
- [ ] The method is more accurate because the experiment is repeated.
- [ ] The method includes more readings so there is less chance for errors.
- [✓] The method reduces the effect of errors when starting and stopping the stopwatch.

[1]

(e) A student plans to carry out more pendulum experiments. He considers possible variables and precautions to improve accuracy.

In the following list, mark the possible variables with the letter **V** and the precautions with the letter **P**.

- [V] amplitude of swing
- [V] length of pendulum
- [V] mass of pendulum bob
- [V] shape of pendulum bob
- [P] use of a reference point to aid counting
- [P] viewing the rule at right-angles when measuring the length

[2]

[Total: 11]

2 A student is investigating the cooling of water.

(a) The thermometer in Fig. 2.1 shows room temperature θ_R at the beginning of the experiment. Record θ_R.

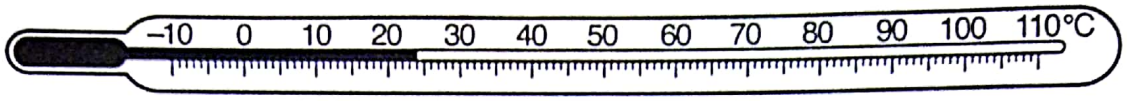

Fig. 2.1

θ_R = 24°C °C [1]

(b) The student pours 50 cm^3 of hot water into a beaker.

He measures the temperature θ_H of the hot water.

θ_H = 86 °C

He adds 50 cm^3 of cold water to the beaker. He stirs the water briefly.

He measures the new temperature θ_M of the water in the beaker.

θ_M = 52 °C

Calculate the temperature fall θ_F using the equation $\theta_F = (\theta_H - \theta_M)$.

86°C − 52°C = 34°C θ_F = 34°C [1]

(c) He repeats the procedure in **(b)** using 100 cm^3 of hot water and 100 cm^3 of cold water.

θ_H = 84 °C

θ_M = 54 °C

Calculate the temperature fall θ_F using the equation $\theta_F = (\theta_H - \theta_M)$.

84°C − 54°C = 30°C θ_F = 30°C [1]

(d) Suggest **one** reason for stirring the water before reading θ_M. [Any 1]

To make sure that the temperature is the same throughout; or To allow the water to mix and reach the final temp. faster [1]

(e) A student states that the temperature fall θ_F should be the same each time because the proportions of hot and cold water are the same.

Suggest **one** reason why θ_F could be significantly different in **(b)** and **(c)**.

1. Heat lost to the surrounding 2. Time delay in transferring the water 3. Student did not wait for thermometer readings to stabilise [1]

(f) Suggest an improvement to the apparatus to make it more likely that θ_F would be the same each time.

Provide insulation

.....

.....[1]

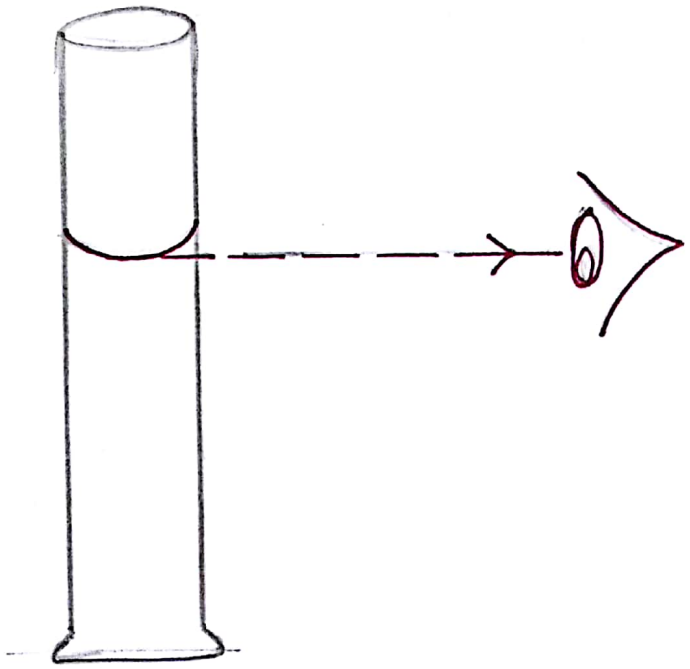
(g) Suggest a condition, not included in your answer to **(f)**, that you would control to make it more likely that θ_F would be the same each time.

1. Same starting temperature of hot / cold water.

OR

2. Same room temperature .....[1]

(h) The student uses a measuring cylinder to measure the volume of water he uses. Draw a measuring cylinder about half-full of water. Show clearly on your diagram the line-of-sight required for obtaining a correct reading for the volume of water.



[3]

[Total: 10]

3 A student is determining the focal length f of a lens.

Fig. 3.1 shows the apparatus used.

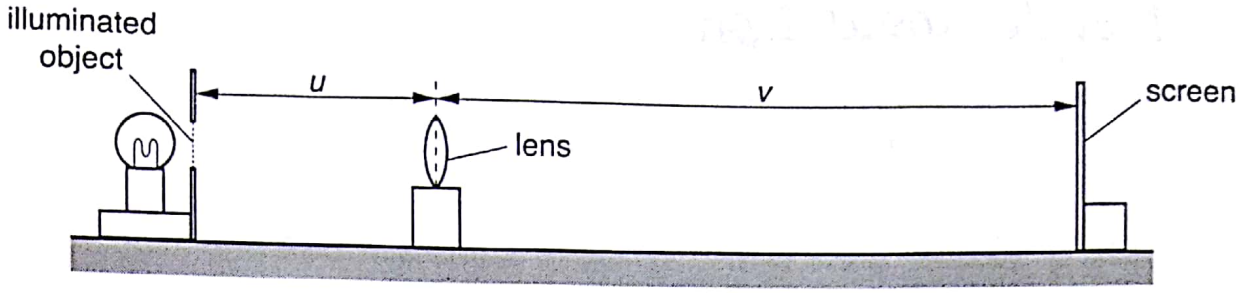


Fig. 3.1

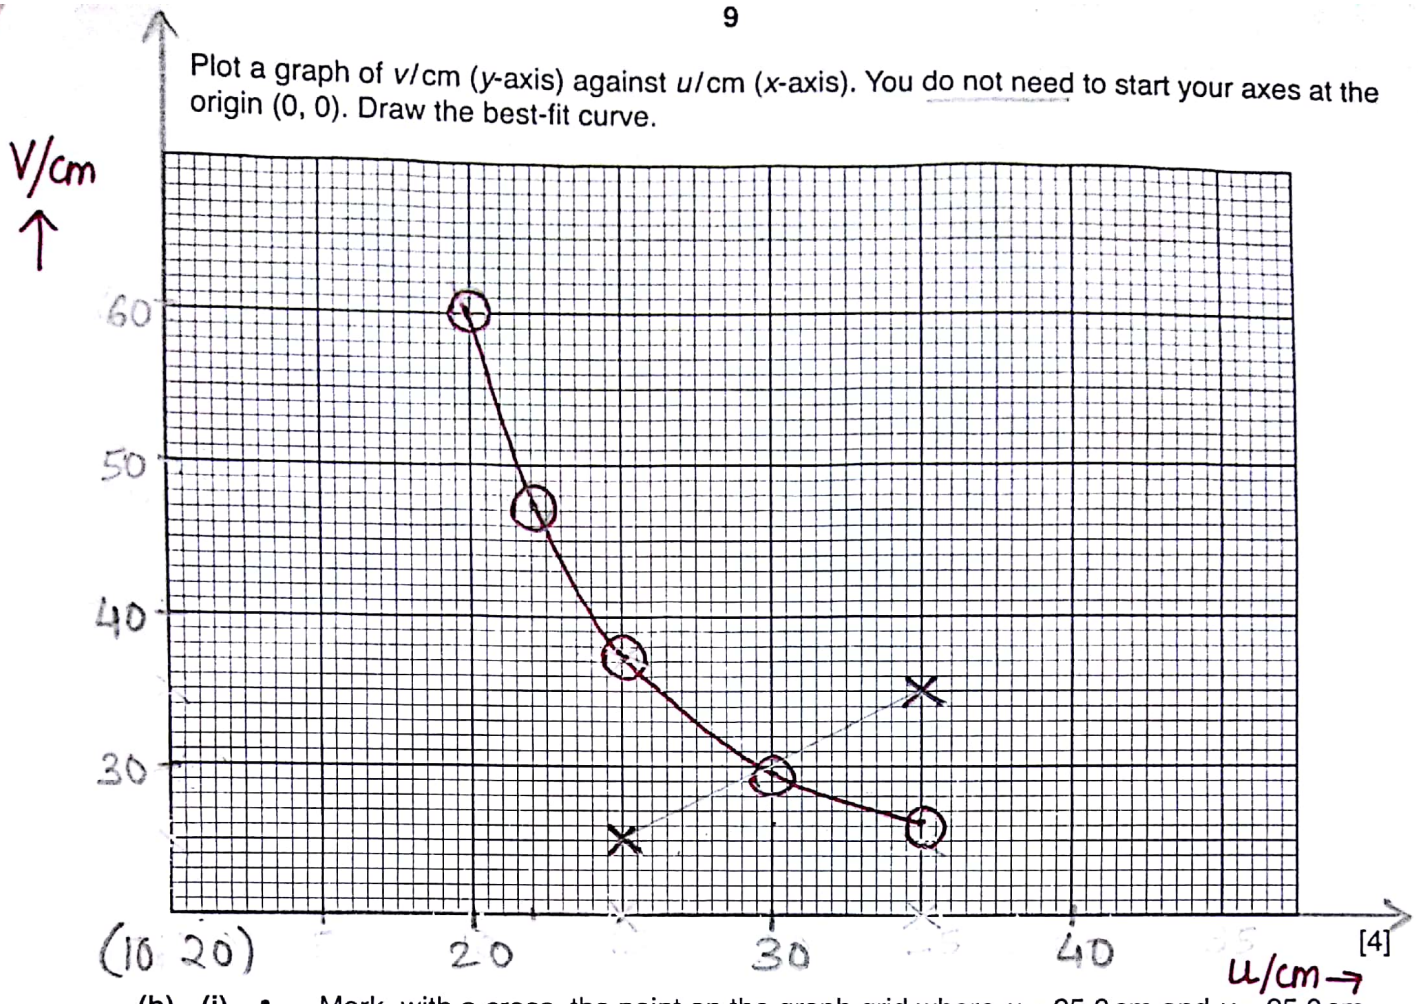
(a)

- The student places the screen about 100 cm from the illuminated object.
- She places the lens between the object and the screen so that the centre of the lens is at a distance $u = 20.0$ cm from the object.
- She adjusts the position of the screen until a clearly focused image is formed on the screen.
- She measures the distance v between the centre of the lens and the screen.
- She repeats the procedure using values for u of 22.0 cm, 25.0 cm, 30.0 cm and 35.0 cm.
- The readings are shown in Table 3.1.

Table 3.1

u/cm	v/cm
20.0	60.0
22.0	47.1
25.0	37.5
30.0	29.8
35.0	26.3

Plot a graph of v/cm (y-axis) against u/cm (x-axis). You do not need to start your axes at the origin (0, 0). Draw the best-fit curve.



[4]

(b) (i)
- Mark, with a cross, the point on the graph grid where $u = 25.0$ cm and $v = 25.0$ cm.
- Mark with a cross, the point on the graph grid where $u = 35.0$ cm and $v = 35.0$ cm.
- Join these two points with a straight line. [1]

(ii)
- Record u_1, the value of u at the point where the straight line crosses your graph line.

u_1 = ... 29 ..... cm

- Record v_1, the value of v at the point where the straight line crosses your graph line.

v_1 = ... 30 ..... cm
[1]

(iii) Calculate the focal length f of the lens using the equation $f = \frac{(u_1 + v_1)}{4}$.

$f = (29+30) \div 4 = 14.75$

V

50 boxes 40

f = ... 14.75 cm ..... cm
[2]

(c) Suggest **two** differences that you would expect to see between the appearance of the illuminated object and the image on the screen.

1. Upside down 3. Coloured edges
2. less bright 4. Different sizes

[2]

(d) Suggest **two** precautions that you would take in order to obtain reliable readings in this experiment.

1. Darkened room (Bright object)
2. Object and lens and screen perpendicular to the bench

[2]

[Total: 12]

3. Clamp the rule to the bench
4. Object and lens, same height from bench [Any 2]

4 A student has a selection of rubber bands of different widths. He is investigating the extension produced by adding loads. Fig. 4.1 shows the set-up used.

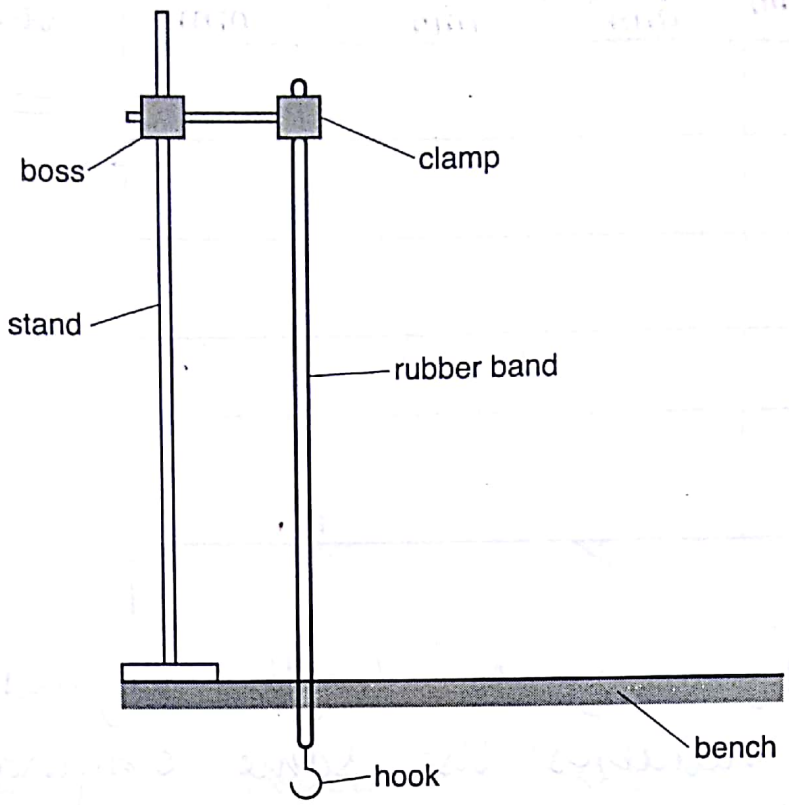


Fig. 4.1

In addition to the apparatus shown in Fig. 4.1, the following apparatus is available to the student:

A metre rule
A selection of different rubber bands
A selection of loads.

Plan an experiment to investigate how strips of rubber of different widths stretch when loaded.

You should

- explain briefly how you would carry out the investigation
- state the key variables that you would control
- draw a table, or tables, with column headings to show how you would display your readings (You are **not** required to enter any readings in the table.)
- explain briefly how you would use your readings to reach a conclusion.

Method: Measure the length of the band. Hang the band to the hook. Suspend a load and note the new length of the band. Repeat the procedure with atleast 5 bands of different thickness for the same load

Band Thickness/mm	Original length (l_o) mm	New length (l_o) mm	Extension (e) mm

load attached = ____ N

attached. Extension = New length - original length ($l - l_o$)
Control variables: Use same original length of each band.
Table: Record the extension and thickness of bands in the table shown above.
Conclusion: Plot a graph of extension against thickness for same load. Compare the data and & conclude if thicker bands stretch more for the same load or vice-versa.
