**0620/21**

Paper 2 Multiple Choice (Extended)

**May/June 2017**

**45 minutes**

Additional Materials: Multiple Choice Answer Sheet  
Soft clean eraser  
Soft pencil (type B or HB is recommended)

\*  
8  
8  
8  
9  
8  
4  
4  
0

**READ THESE INSTRUCTIONS FIRST**

Write in soft pencil.

Do not use staples, paper clips, glue or correction fluid.

Write your name, Centre number and candidate number on the Answer Sheet in the spaces provided unless this has been done for you.

DO **NOT** WRITE IN ANY BARCODES.

There are **forty** questions on this paper. Answer **all** questions. For each question there are four possible answers **A, B, C** and **D**.

Choose the **one** you consider correct and record your choice in **soft pencil** on the separate Answer Sheet.

**Read the instructions on the Answer Sheet very carefully.**

Each correct answer will score one mark. A mark will not be deducted for a wrong answer.

Any rough working should be done in this booklet.

A copy of the Periodic Table is printed on page 16.

Electronic calculators may be used.

The syllabus is approved for use in England, Wales and Northern Ireland as a Cambridge International Level 1/Level 2 Certificate.

This document consists of **16** printed pages.

- 1 Small crystals of purple  $\text{KMnO}_4$  ( $M_r = 158$ ) and orange  $\text{K}_2\text{Cr}_2\text{O}_7$  ( $M_r = 294$ ) were placed at the centres of separate petri dishes filled with agar jelly. They were left to stand under the same physical conditions.

After some time, the colour of each substance had spread out as shown.

The lengths of the arrows indicate the relative distances travelled by particles of each substance.

Which statement is correct?

- A** Diffusion is faster in dish 1 because the mass of the particles is greater.
- B** Diffusion is faster in dish 2 because the mass of the particles is greater.
- C** Diffusion is slower in dish 1 because the mass of the particles is smaller.
- Diffusion is slower in dish 2 because the mass of the particles is greater.

**Reason:**

**The rate of diffusion depends upon the mass of the particles. Heavier particles diffuse slower compared to lighter particles.**

- 2 Pure water has a boiling point of  $100\text{ }^{\circ}\text{C}$  and a freezing point of  $0\text{ }^{\circ}\text{C}$ .

What is the boiling point and freezing point of a sample of aqueous sodium chloride?

	boiling point / $^{\circ}\text{C}$	freezing point / $^{\circ}\text{C}$
<b>A</b>	98	-2
<b>B</b>	98	2
 <b>C</b>	102	-2
<b>D</b>	102	2

**Reason:**

Aqueous sodium chloride is impure water, where sodium chloride is the impurity. Pure substances show a sharp melting and a boiling point. Addition of impurities lowers the melting point (or the freezing point) and raises the boiling point. Hence the freezing point of water goes from  $0^{\circ}\text{C}$  to  $-2^{\circ}\text{C}$  and the boiling point increases from  $100^{\circ}\text{C}$  to  $102^{\circ}\text{C}$ .

3 A chromatogram obtained from the chromatography of four substances is shown.

Which substance has an  $R_f$  value of 0.6?

**$R_f$  value** = ( Distance travelled by the solute) / ( Distance between base line and the solvent front)

Calculating  $R_f$  value using the above formula we get the  $R_f$  value for D as  $6.3/10.5 = 0.6$

4 Sodium reacts with chlorine to form sodium chloride.

Which statements describe what happens to the sodium atoms in this reaction?

- 1 Sodium atoms form positive ions.
- 2 Sodium atoms form negative ions.
- 3 Sodium atoms gain electrons.
- 4 Sodium atoms lose electrons.

A 1 and 3

B 1 and 4

C 2 and 3

D 2 and 4

**Sodium chloride is an ionic compound. Sodium atom loses one electron and the chlorine atom accepts one electron. Hence sodium atom becomes an anion and chlorine atom becomes a negatively charged chloride ion ( a cation)**

5 Diamond is extremely hard and does not conduct electricity.

Which statement explains these properties?

- A It has a lattice of positive carbon ions in a 'sea of electrons'.
- B It has delocalised electrons and each carbon atom forms three covalent bonds with other carbon atoms.
- C It has no delocalised electrons and each carbon atom forms four covalent bonds with other carbon atoms.
- D It has strong ionic bonds between each carbon atom.

**In carbon, each carbon is bonded to 4 other carbon atom and no electrons are set free. Hence there are no delocalised electrons and as a result diamond does not conduct electricity**

6 Which statement about metals is **not** correct?

**A** Metals are malleable because the metal ions can slide over one another.

**B** Metals conduct electricity because electrons can move through the lattice.

**C** Metals consist of a giant lattice of metal ions in a 'sea of electrons'.

 **D** Metals have high melting points because of the strong attraction between the metal ions.

**Metallic bonding exists between the positive metal cations and the negatively charged anions. This electrostatic force of attraction is very strong and hence the ionic compounds have a high melting point**

7 Aluminium reacts with fluorine.

Which values of  $x$ ,  $y$  and  $z$  balance the equation?

	$x$	$y$	$z$
<b>A</b>	1	2	1
<b>B</b>	2	3	2
<b>C</b>	3	2	3
<b>D</b>	4	3	4

**This requires the knowledge of balancing equation. An effort to explain the balancing will further complicate matters....so i suggest watching a video is a better alternative**

8 Carbon monoxide burns in oxygen to produce carbon dioxide.

Which mass of carbon dioxide is produced from 14 g of carbon monoxide?

- A 22 g      B 28 g      C 44 g      D 88 g

**2 moles of CO produces 1 mole of carbon dioxide**

**This means (12+ 16=28g) of CO produces (12+ 2(16)=44 g CO<sub>2</sub> ideally**

**so:**

	<b>CO</b>	:	<b>CO<sub>2</sub></b>
<b>Ideally</b>	<b>28</b>	:	<b>44</b>
<b>Experimentally</b>	<b>14</b>	:	<b>x</b>

**Hence**

$$28x = 14(44)$$

$$x = \frac{14(44)}{28}$$

$$x = 22$$

- 9 Which statement about electrolysis is correct?
- A Electrons move through the electrolyte from the cathode to the anode.
  - B Electrons move towards the cathode in the external circuit.
  - C Negative ions move towards the anode in the external circuit.
  - D Positive ions move through the electrolyte towards the anode during electrolysis.

**Reason: It is a fact that electrons move in the external circuit from the anode to the cathode and the ions move in the electrolyte.**

10 The reactivity series for a number of different metals is shown.

most reactive		→		least reactive	
magnesium	zinc	iron	copper	silver	platinum

The diagram shows different metal strips dipped into an electrolyte.

Which pair of metals produces the highest voltage?

- A copper and magnesium
- B magnesium and platinum
- C magnesium and zinc
- D silver and platinum

**Magnesium and platinum are the furthest apart in the reactivity series. Hence as a rule they will create the highest voltage. Thus the further apart the metals electrodes are in the reactivity series, the greater will be the voltage produced by them.**

11 Some properties of four fuels are shown in the table.

Which fuel is a gas at room temperature and makes two products when it burns in a plentiful supply of air?

	fuel	formula	melting point / °C	boiling point / °C
<b>A</b>	hydrogen	H <sub>2</sub>	-259	-253
 <b>B</b>	methane	CH <sub>4</sub>	-182	-164
<b>C</b>	octane	C <sub>8</sub> H <sub>18</sub>	-57	126
<b>D</b>	wax	C <sub>31</sub> H <sub>64</sub>	60	400

**Reason:**

Although hydrogen is also a gas, it only produces one product and that is water along with the release of heat energy

Also Only the hydrocarbons that have upto 4 carbon atoms are gases at room temperature. Hence Octane and Wax are not gases at room temperature.

Thus methane is the only obvious choice

12 Which statements about exothermic and endothermic reactions are correct?

- 1 During an exothermic reaction, heat is given out.
- 2 The temperature of an endothermic reaction goes up because heat is taken in.
- 3 Burning methane in the air is an exothermic reaction.

A 1, 2 and 3    B 1 and 2 only     C 1 and 3 only    D 2 and 3 only

**Reason:**

**1. An exothermic reaction releases heat to the surroundings. Hence option 1 is correct.**

**3. Methane is a fuel and thus is burnt to release heat energy. So this reaction is also an exothermic reaction**

**2 is wrong because when endothermic reactions take in the heat energy from the surroundings, the temperature decreases**

13 Chlorine reacts with ethane to produce chloroethane and hydrogen chloride.

The reaction is exothermic.

The bond energies are shown in the table.

bond	bond energy in kJ / mol
C-Cl	+340
C-C	+350
C-H	+410
Cl-Cl	+240
H-Cl	+430

What is the energy change for the reaction?

A -1420 kJ / mol

B -120 kJ / mol

C +120 kJ / mol

D +1420 kJ / mol

**Note: Endothermic = +ve**  
**Exothermic = -ve**

**Energy Input:**

1) 1 C-C bond = +350  
 2) 1 Cl-Cl Bond = +240  
 3) 6 C-H bonds = +(410) x 6 = + 2460  
**ToTal energy input: +3050**

**Energy Output:**

1) 1 C-C bond = -350  
 2) 1 Cl-Cl Bond = -0  
 3) 5 C-H bonds = +(410) x 5 = -2050  
 4) 1 C-Cl bond = -340  
 5) 1 H-Cl bond = -430  
**ToTal energy input: -3170**

Hence energy difference = +3050-3170=-120 kJ/mol

14 When sulfur is heated it undergoes a .....1.....change as it melts.

Further heating causes the sulfur to undergo a .....2.....change and form sulfur dioxide.

Which words complete gaps 1 and 2?

	1	2
<b>A</b>	chemical	chemical
<b>B</b>	chemical	physical
<input checked="" type="checkbox"/>	physical	chemical
<b>D</b>	physical	physical

**Reason:**

**When sulfur melts, only a state change is involved, without any change in the chemical nature of the substance.**

**But when sulfur changes to sulfur dioxide, a completely new substance is formed. The chemical properties of sulfur dioxide are different from those of sulfur. Thus it is an example of a chemical change**

15 A student was investigating the reaction between marble chips and dilute hydrochloric acid.

Which changes slow down the rate of reaction?

	temperature of acid	concentration of acid	surface area of marble chips
<input checked="" type="checkbox"/>	decrease	decrease	decrease
<b>B</b>	decrease	decrease	increase
<b>C</b>	increase	decrease	decrease
<b>D</b>	increase	increase	increase

Limestone is largely calcium carbonate.

**Reason:**

**Low temperature means: Less collision amongst reactants and hence less chances of successful collision. Hence the rate of reaction slows down.**

**[Note: Not all collisions of the reactants lead to the formation of a product. SO when we use the word successful collision, all we mean to say is that the collision resulted in the formation of a product]**

**Decrease in the concentration of acid:**

**When acid concentration decreases, it means the concentration of hydrogen ions also decreases. Hence less hydrogen ions are available for a successful collision to take place. Hence the rate of reaction slows down.**

**Decrease in the surface area of the marble chips:**

**When the surface area decreases, less particles of the marble chips are available for collision. Hence the rate of reaction slows down.**

- 16 Nitrogen, hydrogen and ammonia gases are placed inside a container. The container is then sealed. After some time, an equilibrium forms.

Which statement describes the equilibrium in this container?

- A The amount of ammonia remains constant from the moment the container is sealed.
- B The amounts of ammonia, nitrogen and hydrogen in the container are always equal.
- C The rate of formation of ammonia is equal to the rate of decomposition of ammonia.
- D The rate of formation of ammonia is faster than the rate of decomposition of ammonia.

**Equilibrium is reached when:**

**The rate of the forward reaction = the rate of the backward reaction**

**So the breaking down of ammonia = backward reaction and the formation of ammonia is a forward reaction**

17 An example of a redox reaction is shown.

Which statement about the reaction is correct?

- A Zn is the oxidising agent and it oxidises  $\text{Cu}^{2+}$ .
- B Zn is the oxidising agent and it reduces  $\text{Cu}^{2+}$ .
- C Zn is the reducing agent and it oxidises  $\text{Cu}^{2+}$ .
- D Zn is the reducing agent and it reduces  $\text{Cu}^{2+}$ .

**Reason:**

**Zinc gets oxidised as its oxidation number has increased from 0 to +2. Always when a substance gets oxidised, it reduces another compound and so the compound that gets oxidised acts as a reducing agent and vice-versa.**

**Copper has got reduced because its oxidation number has reduced from being +2 to 0**

**Note: All uncombined elements have an oxidation state of "ZERO"**

**Note:  $\text{Cu}^{2+}$  means copper is a positive ion with a charge of +2 and is a part of some compound. This means we know the positive ion is  $\text{Cu}^{2+}$  but have no clues about the negative ion. Similar holds good for zinc.**

18 Zinc oxide is amphoteric.

Which row describes the reactions of zinc oxide?

	reaction with hydrochloric acid	reaction with aqueous sodium hydroxide
	✓	✓
<b>B</b>	✓	x
<b>C</b>	x	✓
<b>D</b>	x	x

key

✓ = reaction occurs

x = reaction does not occur

**Reason: Definition of an amphoteric oxide is an oxide that reacts with both; an acid as well a base**

19 Which row shows how the hydrogen ion concentration and pH of ethanoic acid compare to those of hydrochloric acid of the same concentration?

ethanoic acid compared to hydrochloric acid		
	hydrogen ion concentration	pH
<b>A</b>	higher	higher
<b>B</b>	higher	lower
 <b>C</b>	lower	higher
<b>D</b>	lower	lower

**Reason:**

The hydrogen ion concentration is a measure of the pH of the acid. So an acid with less concentration of hydrogen ions will have a high pH and will be a dilute acid.

**Note:**

Strong acids=Acids that completely ionise in water
Weak acids= Acids that partially ionise in water
Dilute acid= Acids having low concentration of hydrogen ions
Concentrated acids=Acids having high concentration of hydrogen ions

20 A pure sample of the insoluble salt barium carbonate can be made using the method given.

- step 1 Dissolve barium chloride in water.
- step 2 Separately dissolve sodium carbonate in water.
- step 3 Mix the two solutions together.
- step 4 Filter the mixture.
- step 5
- step 6 Dry the residue between two sheets of filter paper.

Which instruction is missing from step 5?

- A Heat the residue to dryness.
- B Heat the residue to the point of crystallisation.
- C Place the filtrate in an evaporating basin.
- D Wash the residue with water.

**Reason:**

**You have been asked to make a pure sample of insoluble barium carbonate.**

**So, to make the salt; which is insoluble barium carbonate completely pure, the residue( insoluble barium carbonate) can be washed quickly with water, as the impurities will dissolve in water leaving the salt in the pure form.**

21 Substance X reacts with warm dilute hydrochloric acid to produce a gas which decolourises acidified aqueous potassium manganate(VII).

Substance X gives a yellow flame in a flame test.

What is X?

- A potassium chloride
- B potassium sulfite
- C sodium chloride
- sodium sulfite

**Reason:**

**Flame test indicates the presence of a metal cation. A yellow colour of the flame test indicates presence of sodium metal**

**How do we know its the sulfite ion and not chloride ion?**

**We'll look at the following instructions which are infact the steps for identifying the presence of sulfite ions**

- Add dilute hydrochloric acid.
- Test the gas given off for sulphur dioxide by passing through pink acidified potassium manganate solution which turns colourless.

**In our question, we have been clearly told that the gas given off decolourises acidified potassium manganate(VII). This means the gas given off was  $\text{SO}_2$  and this proves the presence of sulfite ions**

22 Which element is less reactive than the other members of its group in the Periodic Table?

- A astatine
- B caesium
- C fluorine
- D rubidium

TABLE LIST W/PROPERTIES GAME

**Reason:**

1) Rubidium and Cesium are in group 1 of the periodic table. The reactivity of group 1 elements increases down the group. So of Rb and Cs, Rb is less reactive, but yet these two are highly reactive compared to other elements other group.

Outside the laboratory, Francium is very rare to be found. In trace amounts, it is found in uranium and thorium ores as Fr-223, which continually forms and decays

2) Fluorine is at the top of the periodic table and it is highly reactivity as compared to other elements of its own group.

3) Astatine is in the group 5 of the periodic table . Group 5 is also called the Nitrogen family of elements. The reactivity of the elements decreases down the group. Hence As has very less reactivity.

23 The elements in Group IV of the Periodic Table are shown.

- carbon
- silicon
- germanium
- tin
- lead
- flerovium

What does **not** occur in Group IV as it is descended?

- A The proton number of the elements increases.
- B The elements become more metallic.
- C The elements have more electrons in their outer shells.
- D The elements have more electron shells.

### Electronic configuration of elements in the periodic table

Elements in the periodic table are arranged in groups. Each group has the same number of valence electrons....

Group 1A has 1 valence electron, group 2A has 2 valence electrons, group 3A has 3 valence electrons.....

All group 4 elements have only 4 electrons in their outermost shell. Rather it is not true for any of the groups of the periodic table shown in the diagram!

24 Why are weather balloons sometimes filled with helium rather than hydrogen?

- A Helium is found in air.
- B Helium is less dense than hydrogen.
- C Helium is more dense than hydrogen.
-  Helium is unreactive.

Hydrogen	Helium
<b>LIGHT</b> in mass	<b>LIGHT</b> in mass
<b>DANGER</b> (may lead explosion)	<b>SAFE</b> (chemically stable)
<b>NOT</b> recommended to use	<b>USE</b> : to fill airship or balloons

**Reason:** As shown above since helium gas is chemically stable and is an inert gas and does not catch fire when in contact with fire as again hydrogen that can lead to an explosion and is hence not considered safe to be used in balloons.

25 Metal X is added to a colourless aqueous solution of the sulfate of metal Y.

A coloured solution is formed and metal Y is deposited at the bottom of the beaker.

Which row describes elements X and Y and their relative reactivity?

	type of element	relative reactivity
	X is a transition element	X is more reactive than Y
<b>B</b>	X is a transition element	Y is more reactive than X
<b>C</b>	Y is a transition element	X is more reactive than Y
<b>D</b>	Y is a transition element	Y is more reactive than X

**Reason:**

**X + YSulfate -----> Y + XSulfate..... This is X is morea reactive than Y**

**X is considered to be a transition element because it forms a coloured solution when it reacts with the salt solution of metal Y. It is the basic property of transition metal elements to form coloured compounds**

26 Element E:

- forms an alloy
- has a basic oxide
- is below hydrogen in the reactivity series.

What is E?

- A carbon
- B copper
- C sulfur
- D zinc

**Reason:**

**Copper forms an alloy. Example:**

Alloy	Composition	Properties	Uses
Bronze	<ul style="list-style-type: none"> <li>• 90% copper</li> <li>• 10% tin</li> </ul>	<ul style="list-style-type: none"> <li>• Hard and strong</li> <li>• Doesn't corrode easily</li> <li>• Has shiny surface</li> </ul>	<ul style="list-style-type: none"> <li>• To build statues and monuments.</li> <li>• In the making of medals, swords and artistic materials.</li> </ul>
Brass	<ul style="list-style-type: none"> <li>• 70% copper</li> <li>• 30% zinc</li> </ul>	<ul style="list-style-type: none"> <li>• Harder than copper</li> </ul>	<ul style="list-style-type: none"> <li>• In the making of musical instruments and kitchenware.</li> </ul>
Steel	<ul style="list-style-type: none"> <li>• 99% iron</li> <li>• 1% carbon</li> </ul>	<ul style="list-style-type: none"> <li>• Hard and strong</li> </ul>	<ul style="list-style-type: none"> <li>• In the construction of building and bridges.</li> <li>• In the building of the body of cars and railway tracks.</li> </ul>
Stainless steel	<ul style="list-style-type: none"> <li>• 74% iron</li> <li>• 8% carbon</li> <li>• 18% chromium</li> </ul>	<ul style="list-style-type: none"> <li>• Shiny</li> <li>• Strong</li> <li>• Doesn't rust</li> </ul>	<ul style="list-style-type: none"> <li>• To make cutlery and surgical instruments.</li> </ul>
Duralumin	<ul style="list-style-type: none"> <li>• 93% aluminum</li> <li>• 3% copper</li> <li>• 3% magnesium</li> <li>• 1% manganese</li> </ul>	<ul style="list-style-type: none"> <li>• Light</li> <li>• Strong</li> </ul>	<ul style="list-style-type: none"> <li>• To make the body of aeroplanes and bullet trains.</li> </ul>
Pewter	<ul style="list-style-type: none"> <li>• 96% tin</li> <li>• 3% copper</li> <li>• 1% antimony</li> </ul>	<ul style="list-style-type: none"> <li>• Luster</li> <li>• Shiny</li> <li>• Strong</li> </ul>	<ul style="list-style-type: none"> <li>• In the making of souvenirs.</li> </ul>

**Copper is a metal. Metallic oxides are basic in nature. Hence CuO is a basic oxide.**

27 Zinc metal is extracted from its ore zinc blende in a similar method to that used to extract iron from hematite.

In which way is zinc extraction different from iron extraction?

- A Carbon and carbon monoxide are the main reducing agents.
- B Hot air at the base of the furnace reacts with coke to keep the furnace hot.
- C The metal is removed as a vapour at the top of the furnace.
- D The metal oxide is added into the top of the furnace.

**Reason:**

**Zinc is removed as a vapour at the top of the furnace because the temperature in the furnace is 1673K. This is way above the boiling point of zinc which is 1180K. Hence zinc immediately vapourises and move to the upper parts of the furnace where it is condensed and removed.**

28 Stainless steel is an alloy of iron and other metals. It is strong and does not rust but it costs much more than normal steel.

What is **not** made from stainless steel?

A cutlery

B pipes in a chemical factory

 C railway lines

D saucepans

**Reason; The above question can be answered if you have learnt by heart the uses of stainless steel.**

29 The diagram shows some uses of water in the home.

1

2

3

For which uses is it important for the water to have been treated?

- A 1 only      B 2 only      C 3 only      D 1, 2 and 3

**Reason:**

**In diagram 1, the water is used for consumption by humans. Hence it must be treated before use. The diagram 2 and 3 shows water for car washing and watering plants which need not be treated.**

30 Oxides of nitrogen are found in polluted air.

Which statement about oxides of nitrogen is correct?

- A Oxides of nitrogen are formed by the reaction of nitrogen with oxygen during the fractional distillation of liquid air.
- B Oxides of nitrogen are formed in a car engine by the reaction of petrol with nitrogen from the air.
- C Oxides of nitrogen are removed from exhaust gases by reaction with carbon dioxide in a catalytic converter.
- D Oxides of nitrogen are removed from exhaust gases by reduction in a catalytic converter.

**This is a conceptual question, where you need to know the working of catalytic converters in a car engine.**

## ✓ Catalytic removal of oxides of nitrogen by Catalytic converters

In the car engines, oxides of nitrogen and carbon monoxide are formed.

A catalytic converter is used to remove these poisonous gases.

Catalytic converters use a transition metal catalyst like platinum, palladium or rhodium catalyst with a high surface area. This increases the rate of reaction.

Most catalytic converters have 2 compartments. In the first compartment, the metals mainly catalyse the conversion of nitrogen oxides to nitrogen.

**Compartment (A):-Reduction**

The nitrogen and oxygen from this reaction then flow into compartment B

**Compartment (B):-Oxidation**

The reactions in the catalytic converters are redox reactions. The following reactions might also occur.

The gases leaving the car exhaust are non poisonous but CO<sub>2</sub> contributes to global warming.

31 Photosynthesis and respiration are important natural processes.

Which statement is correct?

- A Carbon dioxide is formed by the reaction of glucose with water during photosynthesis.
- B Carbon dioxide is removed from the air by respiration.
- C Glucose reacts with water to form oxygen during respiration.
- D Photosynthesis produces glucose and oxygen.

**Reason: The following equations will make the concept of photosynthesis and respiration clearer.**

Photosynthesis chemical equation:

Respiration chemical equation:

32 Which row gives the conditions for the Haber process?

	temperature / °C	pressure / atm	catalyst
<b>A</b>	200	2	V <sub>2</sub> O <sub>5</sub>
<b>B</b>	200	450	Fe
 <b>C</b>	450	200	Fe
<b>D</b>	500	250	V <sub>2</sub> O <sub>5</sub>

**Reason: These are the standard conditions to make ammonia via the Haber's process**

Temp: 450 °C  
Press: 200 atm  
Catalyst: Iron

33 Which statement about sulfuric acid is correct?

- A It is made by the Haber process.
- B It is made in the atmosphere by the action of lightning.
- C It reacts with ammonia to produce a fertiliser.
- D It reacts with copper metal to produce hydrogen gas.

**Reason:**

**You need to know the reaction of sulfuric acid with ammonia**

34 Which statement is **not** correct?

- A Converting limestone into lime is a thermal decomposition reaction.
- B Flue gas desulfurisation is a neutralisation reaction.
- C In the extraction of iron, calcium carbonate is converted into calcium oxide.
- D Slaked lime is added to soil as a fertiliser.

**Reason: Slaked lime ( Calcium hydroxide) is added to the soil to reduce soil acidity**

35 Which fraction of petroleum is **not** matched to its correct use?

	fraction	use
<b>A</b>	bitumen	making roads
<b>B</b>	gasoline	fuel for cars
<b>C</b> ✓	kerosene	fuel for ships
<b>D</b>	naphtha	chemical industry

**Reason: You must know the different uses of all the fractions of petroleum**

36 The diagram shows the structures of two organic molecules.

Which statement about these molecules is **not** correct?

- A They are both alcohols.
- B They both produce carbon dioxide and water when they burn in oxygen.
- C They contain different functional groups.
- D They have the same general formula.

Both have the same functional group.  
The -OH group

37 The diagram shows part of the molecule of a polymer.

Which diagram shows the monomer from which this polymer could be manufactured?

**Reason:** A close observation reveals that the following structure keeps repeating on both sides.

Hence we draw the structure of the monomer by replacing the single bond between C-C by a double bond and by removing the continuation bonds on either side.

38 Ethanol is manufactured by fermentation or by the catalytic addition of steam to ethene.  
Which statement is correct?

- A Fermentation uses a higher temperature than the catalytic addition of steam to ethene.
- B Fermentation uses a non-renewable resource.
- C The catalytic addition of steam to ethene produces purer ethanol than fermentation.
- D The catalytic addition of steam to ethene uses a biological catalyst.

**Reason: This is a very famous reaction between ethene and water for the manufacture of ethanol, where ethanol is the only by-product**

Fermentation produces impure ethanol. This is because during fermentation, the impurities such as water and yeast are also present. Hence ethanol formed in this way needs purification via distillation techniques

39 The structure of an ester is shown.

Which row is correct?

	name of ester	names of the carboxylic acid and the alcohol used to form the ester
<b>A</b>	methyl propanoate	methanoic acid and propanol
<b>B</b> ✓	methyl propanoate	methanol and propanoic acid
<b>C</b>	propyl methanoate	methanoic acid and propanol
<b>D</b>	propyl methanoate	methanol and propanoic acid

**While naming an ester, the alcohol comes first followed by name of the acid.**

**So, the above ester is named as: methyl propanoate**

40 Keratin is a protein that is found in human hair.

Keratin is chemically broken down to produce amino acids.

What is the name of this chemical process?

- A catalysis
- B hydration
- ✓ hydrolysis
- D polymerisation

**Reason: Larger molecules ( Macromolecules) are broken down by hydrolysis reactions into their smaller subunits called a s monomers.**

**Proteins are made of amino acids. Since keratin is a protein, it will be broken down to amino acids**

Permission to reproduce items where third-party owned material protected by copyright is included has been sought and cleared where possible. Every reasonable effort has been made by the publisher (UCLES) to trace copyright holders, but if any items requiring clearance have unwittingly been included, the publisher will be pleased to make amends at the earliest possible opportunity.

To avoid the issue of disclosure of answer-related information to candidates, all copyright acknowledgements are reproduced online in the Cambridge International Examinations Copyright Acknowledgements Booklet.
