Paper 5 Practical Test May/June 2010

1 hour 30 minutes

Candidates answer on the Question Paper.

Additional Materials: As listed in Instructions to Supervisors.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use a pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO **NOT** WRITE IN ANY BARCODES.

Answer all questions.

Chemistry practical notes for this paper are printed on page 12.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

For Examiner's Use

3				
Total				

This document consists of **9** printed pages and **3** blank pages.

		lants show differences in the struct af growing in a shaded area (shade	ture of a leaf growing in a sunny area (sun le e leaf).	eaf), For Examiner's Use
(a)	(i)	You are supplied with two leave shade leaf.	s, labelled sun leaf and another leaf labe	
		Make drawings of the two leaves size.	in the spaces provided to show the difference	e in
		sun leaf	shade leaf	[2]
	len	gth of sun leaf = mm	length of shaded leaf =mmm	[2]
	(ii)	Measure and record the maximum the petiole (stalk). Write your measure	n length of each leaf on your drawing, exclud surements below each diagram.	ling
(b)	One	e leaf has a larger surface area thar	n the other.	
	Sug	gest an advantage to the leaf with	the larger surface.	
				[1]

(c) Fig. 1.1 shows cross sections of a sun leaf and a shade leaf as viewed using a microscope.

For Examiner's Use

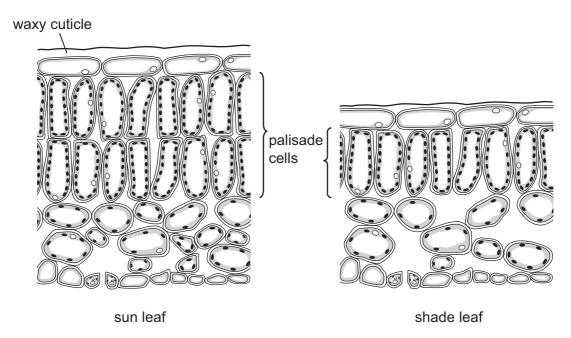

Fig. 1.1

(i) Construct a table to compare the two diagrams shown in Fig. 1.1. Include the following features; thickness of leaf, number of palisade cells, size of air spaces.

[4]

(ii) The sun leaf usually has a thicker cuticle than the shade leaf. The cuticle is a waxy layer covering the leaf.

Suggest an advantage that this thicker cuticle gives to the sun leaf.

[1]

2 You are going to make some measurements on a test-tube before using it to determine the density of **liquid P**.

For Examiner's Use

(a) Measure and record the length, *I*, and the internal diameter, **D**, of the test-tube.

$$l =$$
 mm $D =$ mm

Using these measurements, calculate the volume of the tube using the formula

$$\pi \times \left[\frac{\mathbf{D}}{2}\right]^2 \times \mathbf{l}$$

(b) (i) Hold the test-tube in the glass beaker labelled water and add dry sand to the tube until it floats with its open end about 10 mm above the surface. Place a rule in the water beside the tube and measure the depth, d₁ from the water surface to the bottom of the test-tube. See Fig. 2.1. You may need to hold the tube upright to do this.

Record this value, d_1 in Table 2.2 on page 5.

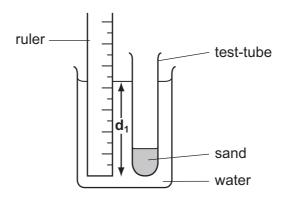

Fig. 2.1

(ii) Remove the test-tube from the water and wipe the outside, taking care not to lose any sand. Do not let water splash into the test-tube. Place the test-tube in the beaker labelled **liquid P** and as before, measure the depth, \mathbf{d}_2 .

Record this value, d_2 in the first line of Table 2.2.

(iii) Remove the test-tube and wipe the outside. Empty out a small amount of sand so that it floats in the water with the open end about 12 or 13 mm above the surface.

Measure and record d_1 , the new depth in Table 2.2.

As before, wipe the outside of the test-tube and transfer it to the **liquid P**.

For Examiner's Use

Measure and record the new depth d_2 in Table 2.2.

(iv) Repeat the process with the tube floating about 2 or 3 mm higher in water each time, until you have five sets of readings of d_1 and d_2 .

Record all your values in Table 2.2.

Table 2.2

d₁in water/mm	d₂in liquid P/mm

[3]

(c) On the grid provided on page 6 (Fig. 2.2), plot a graph of d₁ (vertical axis) against d₂.Draw the best straight line through your points.

Fig. 2.2

[3]

(d) Calculate the gradient of the line, indicating on your graph the values chosen to enable you to do this. The gradient is numerically equal to the density of **liquid P** in grams per centimetre.

gradient of line = [1]

BLANK PAGE

Please turn over for Question 3.

For Examiner's Use

CHEMISTRY PRACTICAL NOTES

Test for anions

anion	test	test result
carbonate (CO ₃ ²⁻)	add dilute acid	effervescence, carbon dioxide produced
chloride (C <i>l</i> ·) [in solution]	acidify with dilute nitric acid, then add aqueous silver nitrate	white ppt.
nitrate (NO ₃ -) [in solution]	add aqueous sodium hydroxide then aluminium foil; warm carefully	ammonia produced
sulfate (SO ₄ ²⁻) [in solution]	acidify then add aqueous barium chloride <i>or</i> aqueous barium nitrate	white ppt.

Test for aqueous cations

cation	effect of aqueous sodium hydroxide	effect of aqueous ammonia
ammonium (NH ₄ ⁺)	ammonia produced on warming	-
copper(II) (Cu ²⁺)	light blue ppt., insoluble in excess	light blue ppt., soluble in excess giving a dark blue solution
iron(II) (Fe ²⁺)	green ppt., insoluble in excess	green ppt., insoluble in excess
iron(III) (Fe ³⁺)	red-brown ppt., insoluble in excess	red-brown ppt., insoluble in excess
zinc (Zn ²⁺)	white ppt., soluble in excess giving a colourless solution	white ppt., soluble in excess giving a colourless solution

Test for gases

gas	test and test results
ammonia (NH ₃)	turns damp red litmus paper blue
carbon dioxide (CO ₂)	turns limewater milky
chlorine (Cl ₂)	bleaches damp litmus paper
hydrogen (H ₂)	"pops" with a lighted splint
oxygen (O ₂)	relights a glowing splint
