Kidney transplant

What is a kidney transplant?

A kidney transplant is a surgical procedure to place a healthy kidney from a live or deceased donor into a person whose kidneys no longer function properly.

Donor: The donated kidney can come from someone you don't know who has recently died (deceased donor), or from a living person—a relative, spouse, or friend. It is important for the donor's blood and tissue to match.

Advantages of kidney transplant:

- It is a long term solution. The person no longer needs dialysis.
- The person can lead a better quality of life.
- The person can have a wider diet.
- He can have a better or a more efficient control over the composition of blood.
