Paper 4 Theory (Extended)

October/November 2018

1 hour 15 minutes

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO **NOT** WRITE IN ANY BARCODES.

Answer **all** questions.

Electronic calculators may be used.

A copy of the Periodic Table is printed on page 16.

You may lose marks if you do not show your working or if you do not use appropriate units.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

The syllabus is approved for use in England, Wales and Northern Ireland as a Cambridge International Level 1/Level 2 Certificate.

This document consists of **13** printed pages and **3** blank pages.

- 1 Element X can undergo the following physical changes.

- (a) (i) Give the scientific name for each of the numbered physical changes.

1 **Melting**

2 **Condensing**

3 **Freezing**

4 **Sublimation**

[4]

- (ii) Explain why the changes shown are physical changes.

No new substances are made

[or]

The change can be reversed by a physical process.

[1]

- (iii) One difference between boiling and evaporation is the rate at which the processes occur.

State **one** other difference between boiling and evaporation.

Boiling happens at a specific temperature

[or]

Evaporation happens over a range of temperatures

[1]

- (b) Describe the separation, arrangement and motion of particles of element X in the solid state.

separation **Touching**

arrangement **Regular**

motion **Vibrate**

[3]

- (c) Element X is a Group I metal. It burns in air to form an oxide X₂O.

Write a chemical equation for this reaction.

[2]

[Total: 11]

2 Magnesium, calcium and strontium are Group II elements.

(a) Complete the table to show the arrangement of electrons in a calcium atom.

shell number	1	2	3	4
number of electrons	2	8	8	2

[1]

(b) Describe how the arrangement of electrons in a strontium atom is:

(i) similar to the arrangement of electrons in a calcium atom

Same number of outer electrons

.....

(ii) different from the arrangement of electrons in a calcium atom.

Sr has outer electrons in the 5th shell

.....

[2]

(c) Calcium reacts with cold water to form two products:

- a colourless gas, **P**, which 'pops' with a lighted splint
- a weakly alkaline solution, **Q**, which turns milky when carbon dioxide is bubbled through it.

(i) Name gas **P**.

Hydrogen

..... [1]

(ii) Identify the ion responsible for making solution **Q** alkaline.

Hydroxide [or] OH⁻

..... [1]

(iii) Suggest the pH of solution **Q**.

7 < pH ≤ 12

..... [1]

(iv) Write a chemical equation for the reaction of calcium with cold water.

Ca + 2H₂O → Ca(OH)₂ + H₂

..... [2]

(d) Magnesium reacts with chlorine to form magnesium chloride, MgCl_2 . Magnesium chloride is an ionic compound.

(i) Complete the diagrams to show the electronic structures of the ions in magnesium chloride. Show the charges on the ions.

[3]

(ii) Give **three** physical properties that are typical of ionic compounds such as MgCl_2 .

- 1 **High melting point [or] high boiling point**
- 2 **Dissolve in water**
- 3 **Conduct (electricity) when molten [or] conduct (electricity) in aqueous solution**

[3]

(e) Aqueous magnesium chloride is added to aqueous silver nitrate. A white precipitate forms.

Write an **ionic** equation for this reaction. Include state symbols.

[2]

[Total: 16]

3 Sulfur is an important element.

(a) Explain how burning fossil fuels containing sulfur leads to the formation of acid rain.

Sulfur dioxide [or SO₂ is formed]. This SO₂ reacts with atmospheric water vapour[or rain] to form acid rain

.....

.....

[2]

(b) Sulfuric acid is manufactured by the Contact process. One step in the Contact process involves a reversible reaction in which sulfur trioxide, SO₃, is formed.

(i) Write a chemical equation for this reversible reaction. Include the correct symbol to show that the reaction is reversible.

[2]

(ii) State the conditions and name the catalyst used in this reversible reaction.

temperature **450 °C**

.....

pressure **1-5 atmospheres**

.....

catalyst **Vanadium (V) oxide [or vanadium pentoxide or V₂O₅]**

.....

[3]

(iii) Describe how the sulfur trioxide formed is converted into sulfuric acid in the next steps of the Contact process.

SO₃ added to concentrated H₂SO₄ to form oleum. Oleum is diluted with water to form sulfuric acid

.....

.....

[2]

(c) Dilute sulfuric acid is used to make salts known as sulfates.

A method consisting of three steps is used to make zinc sulfate from zinc carbonate.

step 1 Add an excess of zinc carbonate to 20 cm³ of 0.4 mol/dm³ dilute sulfuric acid until the reaction is complete.

step 2 Filter the mixture.

step 3 Heat the filtrate until a saturated solution forms and then allow it to crystallise.

(i) Name a suitable piece of apparatus for measuring 20 cm³ of dilute sulfuric acid in **step 1**.
Measuring cylinder

..... [1]

(ii) State **two** observations which would show that the reaction is complete in **step 1**.

1 **No more fizzing**

.....

2 **ZnCO₃ stops dissolving**

.....

[2]

(iii) Why is it important to add an excess of zinc carbonate in **step 1**?

To use up all the acid [or to use up all the H⁺ ions]

..... [1]

(iv) What is meant by the term *saturated solution* in **step 3**?

A solution that can hold no more solute at the specified temperature .

.....

..... [2]

(v) The equation for the reaction is shown.

Complete the equation by inserting the state symbol for zinc sulfate. [1]

(vi) Name another zinc compound which could be used to make zinc sulfate from dilute sulfuric acid using this method.

Zinc oxide [or zinc hydroxide]

..... [1]

(vii) Suggest why this method would **not** work to make barium sulfate from barium carbonate and dilute sulfuric acid.

Barium sulfate is insoluble

..... [1]

- (d) In a titration, a student added 25.0 cm³ of 0.200 mol/dm³ aqueous sodium hydroxide to a conical flask. The student then added a few drops of methyl orange to the solution in the conical flask.

Dilute sulfuric acid was then added from a burette to the conical flask. The volume of dilute sulfuric acid needed to neutralise the aqueous sodium hydroxide was 20.0 cm³.

- (i) What was the colour of the methyl orange in the aqueous sodium hydroxide?

yellow

..... [1]

- (ii) Determine the concentration of the dilute sulfuric acid in g/dm³.

- Calculate the number of moles of aqueous sodium hydroxide added to the conical flask.

Note: We need to convert the volume from cm³ to dm³

Concentration

= Moles x Volume

= 0.2 × 25 / 1000

= 5(.00) × 10⁻³ or 0.005

0.005

..... mol

- Calculate the number of moles of dilute sulfuric acid added from the burette.

Moles of H₂SO₄

= Half of NaOH moles

= 0.005 / 2

= 2.5 × 10⁻³ or 0.0025

Note: From the ideal mole ratio, for every 2 moles of NaOH, we have 2 mole of H₂SO₄

0.0025

..... mol

- Calculate the concentration of the dilute sulfuric acid in mol/dm³.

Concentration

= Moles/volume

= 2.5 × 10⁻³ × 1000 / 20

= 0.125

Note: We need to convert the volume from cm³ to dm³

0.125

..... mol/dm³

- Calculate the concentration of the dilute sulfuric acid in g/dm³.

Concentration in g/dm³

= 0.125 × 98 = 12.25

M_r of sulfuric acid = 98g. Hence we need to multiply the moles by the M_r

12.25

..... g/dm³

[4]

(e) Iron(II) sulfate decomposes when heated strongly.

15.20 g of $\text{FeSO}_4(\text{s})$ was heated and formed 4.80 g of $\text{Fe}_2\text{O}_3(\text{s})$.

[M_r , $\text{FeSO}_4 = 152$; M_r , $\text{Fe}_2\text{O}_3 = 160$]

Calculate the percentage yield for this reaction.

$$\begin{aligned} \text{Mol FeSO}_4 &= \text{Mass} / M_r \\ &= 15.2 / 152 \\ &= 0.1 \end{aligned}$$

$$\begin{aligned} \text{Expected mol of Fe}_2\text{O}_3 &= \text{From the ideal mole ratio, moles of Fe}_2\text{O}_3 \text{ are half those of FeSO}_4 \\ &= 0.1 / 2 \\ &= 0.05 \end{aligned}$$

$$\begin{aligned} \text{Actual mol of Fe}_2\text{O}_3 &= \text{The moles obtained through experimentation} \\ &= 4.80 / 160 \\ &= 0.03 \end{aligned}$$

60 % [3]

[Total: 26]

$$\begin{aligned} \text{Percentage yield} &= [\text{Actual yield} / \text{Predicted yield}] \times 100 \\ &= 100 \times [0.03 / 0.05] \\ &= 60\% \end{aligned}$$

- 4 A student investigated the progress of the reaction between dilute hydrochloric acid, HCl , and an excess of large pieces of marble, CaCO_3 , using the apparatus shown.

- (a) A graph of the volume of gas produced against time is shown.

- (i) How does the shape of the graph show that the rate of reaction decreased as the reaction progressed?

Gradient gets less

.....
 [1]

- (ii) Why did the rate of reaction decrease as the reaction progressed?

Concentration of HCl is decreasing

..... [1]

- (iii) After how many seconds did the reaction finish?

120

..... s [1]

- (b) The experiment was repeated using the same mass of smaller pieces of marble. All other conditions were kept the same.

Draw a graph **on the grid** to show the progress of the reaction using the smaller pieces of marble. [2]

- (c) The original experiment was repeated at a higher temperature. All other conditions were kept the same.

Describe and explain, in terms of collisions between particles, the effect of using a higher temperature on the time taken for the reaction to finish.

At higher temperature , the time taken for the reaction to complete is less . This is because the particles have more energy and move faster. There are more collisions of particles per unit time. Collisions have energy greater than activation energy. Collisions have sufficient energy to react . A greater percentage of teh collisions are successful. Hence at a higher temperature, the time taken for the reaction to finish will be lesser

[5]

[Total: 10]

- 5 Alkynes are a homologous series of unsaturated hydrocarbons. All members contain a C≡C triple bond.

(a) Complete the table showing information about the first **three** alkynes.

formula	C ₂ H ₂	C ₃ H ₄	C ₄ H ₆
structure	H-C≡C-H	H-C≡C-CH ₃	H-C≡C-CH ₂ -CH ₃
name	ethyne	propyne	butyne

[2]

- (b) Complete the dot-and-cross diagram to show the electron arrangement in a molecule of ethyne, H-C≡C-H. Show outer shell electrons only.

[2]

(c) Compounds in the same homologous series have the same general formula.

- (i) Give **two** other characteristics of members of a homologous series.

1 **Similar chemical properties [or same chemical properties]**

2 **Contain the same functional group**

or: Show a gradual change in physical properties or consecutive members differ by CH₂ or common methods of preparation

- (ii) Use the information in the table in (a) to deduce the general formula of alkynes.

C_nH_{2n-2}

[1]

(d) Alkynes are unsaturated.

Describe a test for unsaturation.

test **Bromine water [or aqueous bromine]**

result **Changes to colourless [or decolourises]**

[2]

- (e) (i) Name an oxidising agent which can be used to oxidise ethanol to ethanoic acid.

Acidified potassium manganate (VII)

[2]

- (ii) Draw the structure of ethanoic acid. Show all of the atoms and all of the bonds.

[1]

- (f) Carboxylic acids can be converted into esters.

- (i) The ester formed by reacting propanoic acid and methanol has the molecular formula $C_4H_8O_2$.

Name this ester and draw its structure. Show all of the atoms and all of the bonds.

name of the ester **Methyl propanoate**

structure of the ester

[2]

- (ii) Name another ester with the molecular formula $C_4H_8O_2$.

Ethyl acetate

[1]

- (g) Polyesters are polymers.

- (i) What type of polymerisation is used in the manufacture of polyesters?

Condensation

[1]

- (ii) Name a polyester.

Terylene

[1]
