

Calculate energy of a reaction using bond energies

- Bond energy (Bond enthalpy) is the amount of energy required to break 1 mole of a particular covalent bond in the gaseous state in to gaseous atoms(under standard thermodynamic conditions).It is a measure of the strength of a bond.
- Symbol of bond energy is E.

Example:

$E(\text{H}-\text{H}) = +436 \text{ kJ/mol}$. It means that 436kJ of energy are needed to break the bonds in 1 mole of hydrogen molecules.

- Bond energies are always +ve. This is because they refer to the bonds being broken.
-

Application based questions showing you how to calculate energy changes in a reaction.

Question: Calculate the energy in the reaction:

$2\text{H}_2(\text{g}) + \text{O}_2(\text{g}) \rightarrow 2\text{H}_2\text{O}(\text{g})$

Bond energy values in kJ/mol

- H-H $\rightarrow 436$
- O=O $\rightarrow 498$
- O-H $\rightarrow 464$

| Bonds broken (Endothermic) | Bonds formed (Exothermic) |
|--|-------------------------------------|
| $2\text{H}-\text{H} = 2(436) = 872\text{KJ}$ | $4(\text{O}-\text{H}) =$ |
| $1\text{O}=\text{O} = 498\text{KJ}$ | 4×464 |
| Total $+1370\text{KJ}$ | $= 1856\text{KJ}$ |

∴ Adding both energy values we get:
 $+1370\text{KJ} - 1856\text{KJ} = -486\text{KJ}$

∴ Overall energy change is exothermic

$2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}$
 $\text{H}-\text{H} + \text{O}=\text{O}$
 $\text{H}-\text{H}$

Bonds broken
Endothermic

Bonds formed
Exothermic
